In class assignment 13

1. variable names start with a \$ in php
2. Associative Arrays behave a bit like objects in JS or dictionaries in python
3. A template literal in PHP would be double quoted strings
4. php is loosely typed - we don't set types for variables, they are dynamically typed
5. The include statement takes all the text/code/markup that exists in the specified file and copies it into the file that uses the include statement.
6. Create a PHP application that when accessed via its domain in a browser(localhost) an HTML page is returned. On that HTML page include a button that when clicked makes use of jQuery code to request and show data from the PHP backend.
